

EnviroServe Chemicals, Inc.

***Your Single Source
Chemical Supplier for All of Your
Paint Stripping Applications***

We know what it takes:

Products, Service, Support and Equipment

EnviroServe Chemicals: *Expertly qualified to be your single source industrial chemical supplier!*

EnviroServe has been a service-oriented supplier of industrial chemical products since 1996. No other company can match our wide range of products, service, support, and equipment!

When a painting job goes "sour" and your customer won't accept the paint finish, often the last resort is to strip or remove the paint coating.

Paint stripping (depainting as it is sometimes referred to) is expensive and one usually hopes to avoid its need. But when stripping is the only alternative, **EnviroServe Chemicals** has the answers for your stripping needs with products and our professional staff of chemists, service technicians and technical sales representatives.

Today's new paints types and environmental requirements have made paint stripping complex and more difficult than ever before. **EnviroServe Chemicals** can provide you with paint stripper products for every paint stripping operation including floor maintenance and paint stripping of equipment in your painting department. In both small and large paint lines when the coating finish is excellent, heavy deposits of coatings sometimes collect on conveyors, hooks, floor gratings and coating racks. These excessive build-ups need to be removed periodically to allow the coating process to continue without blemishes. This holds especially true in electro-static type paint systems.

No one method or product works best for all of the various paints and finishes you're likely to encounter today. Fortunately, the arcane art of stripping paints and finishes has come a long way over the last three decades. In fact, the development of so many different stripping chemicals has grown so much in recent years that it's hard to keep track of all the different technologies. Because **EnviroServe Chemicals** understands what the various systems are and how they work, we can help make your stripping process operate as smoothly as possible. Among the many **EnviroServe Chemicals'** specialties, its large variety of products designed to remove today's modern paints and finishes has always been a major forerunner in terms of performance. Some of the many uses for our stripper products include: reworking defective parts; stripping paint hooks, stalks and other tools used on paint lines; remanufacturing processes; and others. **EnviroServe Chemicals** remains at the fore front of the industry when it comes to the terms of employee safety and respect for the environment. We continuously strive to make all our strippers as safe and as environmentally friendly as possible. Our wide range of stripper products includes hot and cold immersion, thixotropic, acid, alkaline, solvent and neutral strippers.

***PAIN*T STRIPPERS**

Hot immersion alkaline paint stripping is an effective way to remove paint, dirt and rust. Entire car bodies can be dipped into a tank for several hours where the caustic solutions will flow into areas where media-blasters would never get. Chemical-stripping typically leaves the item looking fresh and clean, ready for the paint shop. There are a few concerns to this process that should be mentioned; all chemicals must be removed (and sometimes treated with a metal pretreatment system) so that it does not bleed into the new paint or primer. Finally, this type of stripper is not suitable for aluminum and galvanized parts. Cold immersions are very similar to hot immersion strippers but since they are not heated, they generally take a considerably longer time to work.

Alkaline/solvent immersion strippers are also excellent. They combine alkalinity with certain solvents and may be used hot or cold. These type strippers are specialized for harder to remove paints and finishes and generally work very well on powder paints.

We have developed a proprietary blend of alkaline/solvents to effectively strip paint hooks overnight, without heat. This product has quickly become the work horse in our paint stripping series of products.

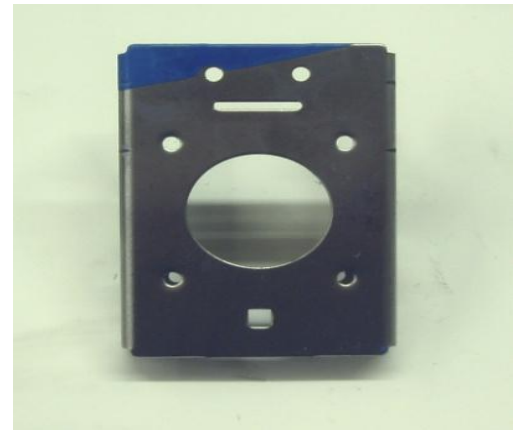

Solvent based hot and cold tank-stripping is a very effective way to remove most paints without the use of high alkaline (caustic) solutions. This process normally requires some mixing and agitation. These strippers are generally safe on aluminum, zinc galvanized steel, and magnesium.

EnviroServe Chemicals has several fast acting paint strippers. Most are powerful and yet safe to handle. These stripper formulations will safely remove almost all wet and powder coated paints from metals, including epoxy primers.

Note:

If you are using commodity caustic and have a need for stripping additives to help speed up or to improve the actual stripping process, we have several options we can offer.

Instead of outsourcing your paint stripping needs, let us help you keep your stripping and profits where they belong: in your own facility!

EnviroServe Chemicals

The industry leader in paint stripping technology!

TESTING CAPABILITIES

EnviroServe Chemicals' R&D laboratory is very well equipped and staffed with highly qualified chemists and engineers to carry out research and product development, equipment design and to perform customer required testing as needed. Below is a partial list of the equipment and testing available for our customer's benefits!

Equipment

Hot Water High Pressure Spray Wand System
In-house 7 Stage Pilot Spray Washer
Agitated Immersion Washers
Powder Paint Booth
Industrial Cure Oven
Liquid Paint System
Salt Spray Cabinets
Humidity Chambers
Electronic Analytical Balances
pH and Conductivity Meters

Testing

Conversion Coating Weights
Paint Adhesion Testing & Measuring
Dry Film Thickness
Impact Test
Conical Mandrel Test
Film Hardness Test
Salt Spray Test
Total Dissolved Solids
Total and Active Acid or Alkalinity Tests
Scanning Electron Atomic Force Micrograph
(at NCSU and Duke University)

EQUIPMENT

EnviroServe Chemicals can supply a wide range of manually and automatically controlled metering devices to ensure effective control of your pretreatment operating parameters. Consult your **EnviroServe Chemicals** representative for more details.

For further information, recommendations and other regulatory information please refer to the individual Product Data and Material Safety Data Sheets and/or contact **EnviroServe Chemicals**.

Find out how **EnviroServe Chemicals** can improve your pretreatment processes, reduce your energy costs and provide a better solution for your conversion coating needs.
