Large Office Furniture Manufacturer Turns to EnviroServe for Help

Dunn, NC – *EnviroServe Chemicals* helps a large office equipment manufacturing plant switch from its current supplier of many years to *EnviroServe's* iron phosphate systems. Their parts are significantly cleaner and have a much more uniform coating on them.

The paint line supervisor at this large manufacturing facility said, “I have never seen parts this clean! There is no oil in the recessed handle areas where we have always had cleaning issues before. The coating looks uniform. Before the changeover, our parts were always streaky and splotchy looking.”

The company was lacking the service they needed from their current chemical supplier. They did not know what type of paint adhesion or corrosion resistance they were achieving nor did they have a history of salt spray testing. Since *EnviroServe* has taken over the pretreatment process, there are quarterly testing policies in place and there is a requirement for each of the many powder coating color options they offer their customers.
